Abstract

Quality evaluation is crucial to guaranteeing the dependability and uniformity of suppliers' products, components, and services. An overview of important topics concerning the evaluation of supplier quality is presented in this study. The evaluation includes everything from product quality and regulatory compliance to production methods, delivery times, customer service, financial stability, and the supplier's general reputation. Businesses may build a robust supply chain, ensure customer happiness, and make educated choices regarding supplier agreements by carefully considering these factors. Considering a supplier's dedication to innovation, long-term relationship possibilities, and ongoing development is also essential to evaluating their quality. Decreased defects and recalls, increased operational efficiency, better brand perception, regulatory compliance, and reduced risk are all advantages of a thorough review. Businesses can stay ahead of the competition and provide consumers with better goods and services if they prioritize supplier quality inspections. We used multi-criteria decision-making (MCDM) to deal with conflicting criteria in assessing the quality of suppliers. The neutrosophic set deals with uncertain information in the assessment process. The neutrosophic set is integrated with the MCDM method, such as the TOPSIS method. The TOPSIS method is used to rank the suppliers. We conducted this study at a drug company. We used 15 criteria and 20 suppliers. We conducted a sensitivity analysis to ensure the stability of the results.

Keywords: Single valued neutrosophic sets, Uncertainty, Assessment, MCDM, Supplier, Supply chain, TOPSIS method.

1 | Introduction

Businesses across a wide range of sectors rely heavily on supplier quality assessments. Businesses depend on suppliers to provide high-quality products, parts, and services that match their specifications. Companies may keep product quality constant, reduce risk, and maintain customer happiness by assessing supplier quality. Companies may build a robust supply chain that helps them achieve their goals by carefully evaluating their suppliers. This will allow them to make educated choices about their relationships [1–3]. To find reliable and suitable suppliers, it is necessary to evaluate their quality thoroughly. Product quality, manufacturing

procedures, delivery performance, customer service, supplier reputation, financial stability, and regulatory compliance are all aspects that fall under this category. Suppliers' capacity to reliably satisfy quality standards, meet supply needs, and provide continuous support may be assessed by looking at these factors [4–6].

A supplier's quality management system, including their certifications, quality control methods, and compliance with applicable industry standards, is usually reviewed thoroughly at the beginning of the evaluation process [7, 8]. Production facilities, equipment, and compliance with good manufacturing standards are some aspects that businesses evaluate via on-site audits and inspections [9, 10]. Quality evaluations of suppliers also heavily rely on supplier performance indicators, including on-time delivery rates, defect rates, and customer complaints. Evaluating the current status of a supplier's operations is only the beginning of a thorough supplier quality evaluation. Thinking about their dedication to innovation, long-term collaboration possibilities, and constant progress is also part of it. Suppliers who take the initiative to improve quality, allocate resources to R&D, and align with the long-term objectives of the customer are more likely to help the buyer succeed and create a win-win partnership [11, 12].

Robust supplier quality evaluation has several advantages. Improved operational efficiency, fewer product defects and recalls, compliance with regulations, and risk mitigation in the supply chain are all benefits that businesses get from this tool. Companies may keep their competitive advantage, improve their brand image, and provide consumers with better goods and services by choosing high-quality suppliers [13, 14]. Ultimately, evaluating suppliers' quality is an essential step for companies looking to build a solid and effective supply chain. Businesses may make sure their suppliers are up to snuff in terms of quality, strategic fit, and long-term performance by using a variety of evaluation metrics. Supply chain management relies on thorough supplier quality assessments to remain competitive, produce high-quality goods, reduce risks, and keep customers happy [15, 16].

A supplier quality assessment system must include efficient and frequent evaluations of supplier quality. When just one supplier or component has to be evaluated, multi-criteria decision-making (MCDM) approaches are the way to go [17-19]. We used the neutrosophic set to overcome uncertainty in the assessment process. Many MCDM researchers have been captivated by the ambiguity and time-periodic nature of the data [20-22]. Various periods are required to depict periodic occurrences in real life, a common source of decision-making challenges. None of the classic fuzzy set theory models using actual membership or non-membership grades can adequately characterize such issues [23-25]. To solve these MCDM challenges, criteria and alternatives might be given complicated membership grades [26-28].

2 | Materials and Methods

In this section, the single valued neutrosophic TOPSIS method is introduced to assess the quality of supplier and rank the suppliers to select best one [29-30]. The steps of the TOPSIS method are introduce in Figure. 1.

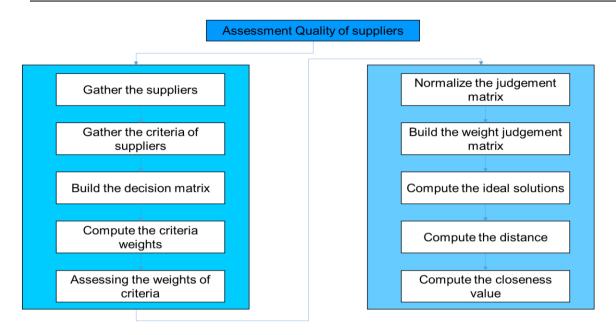

Figure 1. The steps of the proposed method.

In this section, the single valued neutrosophic TOPSIS method is introduced to assess the quality of supplier and rank the suppliers to select best one [29-30]. The steps of the TOPSIS method are introduce in Figure 1. **Step 1.** Build the judgment matrix.

$$\mathbf{A} = \begin{bmatrix} \mathbf{a}_{11} & \cdots & \mathbf{a}_{1n} \\ \vdots & \ddots & \vdots \\ \mathbf{a}_{m1} & \cdots & \mathbf{a}_{mn} \end{bmatrix} \tag{1}$$

Where a_{11} refers to the value in decision matrix, m refers to the number of alternatives and n refers to the number of criteria. i = 1, 2, ... m; j = 1, 2, ... n.

Step 2. Normalize the judgment matrix.

$$Y_{ij} = \frac{a_{ij} - \min a_{ij}}{\max a_{ij} - \min a_{ij}}; \text{Positive criteria.}$$
 (2)

$$Y_{ij} = \frac{\min a_{ij} - a_{ij}}{\max a_{ij} - \min a_{ij}}; \text{Negative criteria.}$$
(3)

$$Y = \begin{bmatrix} y_{11} & \cdots & y_{1n} \\ \vdots & \ddots & \vdots \\ y_{m1} & \cdots & y_{mn} \end{bmatrix}$$
 (4)

Step 3. Compute the weights of criteria.

Step 4. Build the weight judgment matrix.

$$\mathbf{d}_{ij} = \mathbf{w}_i * \mathbf{y}_{ij} \tag{5}$$

$$D = \begin{bmatrix} d_{11} & \cdots & d_{1n} \\ \vdots & \ddots & \vdots \\ d_{m1} & \cdots & d_{mn} \end{bmatrix}$$
 (6)

Step 5. Compute the ideal solutions.

The ideal solutions are computed for positive and negative criteria:

$$E^{+} = (E_{1}^{+}, E_{2}^{+}, \dots E_{n}^{+}) \tag{7}$$

$$E^{+} = (\max\{e_{11}, e_{21}, \dots e_{m1}\}, \max\{e_{12}, e_{22}, \dots e_{n1}\}, \dots \max\{e_{1n}, e_{2n}, \dots e_{mn}\})$$
(8)

$$E^{-} = (E_{1}^{-}, E_{2}^{-}, \dots E_{n}^{-})$$
(9)

$$E^{-} = (\min\{e_{11}, e_{21}, \dots e_{m1}\}, \min\{e_{12}, e_{22}, \dots e_{n1}\}, \dots \min\{e_{1n}, e_{2n}, \dots e_{mn}\})$$
(10)

Step 6. Compute the distance from each suppliers and the ideal solutions for positive and negative criteria.

$$T_i^+ = \sqrt{\sum_{j=1}^n (E_i^+ - E_{ij})^2}$$
 (11)

$$T_{i}^{-} = \sqrt{\sum_{j=1}^{n} (E_{i}^{-} - E_{ij})^{2}}$$
 (12)

Step 7. Compute the closeness value.

$$O_{i} = \frac{T_{i}^{-}}{T_{i}^{+} + T_{i}^{-}} \tag{13}$$

3 | Results

In this section, we provide a case study for evaluating the quality of suppliers in a drug company to select the best one from 20 suppliers. We collected 15 criteria, as shown in Figure 2.

- Step 1. Build the judgment matrix using Eq. (1).
- Step 2. Normalize the judgment matrix for positive and negative criteria by Eqs. (2-4) as shown in Table 1.
- **Step 3.** Compute the weights of criteria as shown in Figure 3. We show the Regulatory Compliance is the best criterion and Corporate Social Responsibility is the worst criterion.

Figure 2. The 15 criteria of suppliers in Drug Company.

Table 1. Normalization judgment matrix.

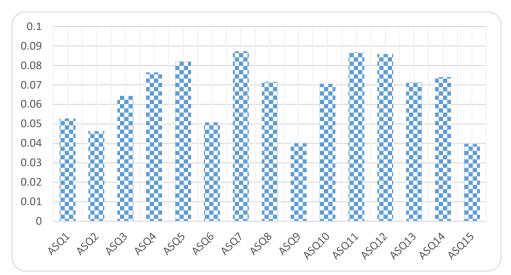

Figure 3. The weights of 15 criteria in quality assessment suppliers.

- Step 4. Build the weight judgment matrix by Eqs. (5) and (6) as shown in Table 2.
- Step 5. Compute the ideal solutions for positive and negative criteria using Eqs. (7–10).
- Step 6. Compute the distance from each supplier and the ideal solutions for positive and negative criteria using Eqs. (11) and (12).
- Step 7. Compute the closeness value using Eq. (13) as shown in Figure 4. We show that supplier 16 is the best and supplier 2 is the worst.

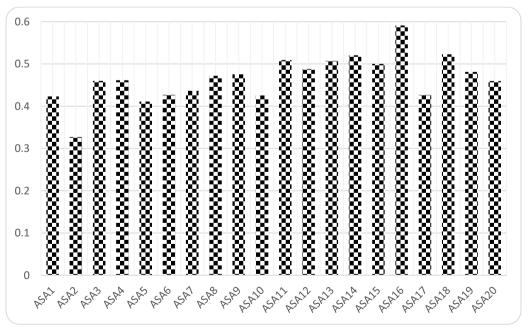

Figure 4. The rank of 20 suppliers in Drug Company.

4 | Sensitivity Analaysis

In this section, we change the criteria weights and then rank the alternatives to show the stability of the results and the suggested methodology. Figure 5 shows the 15 cases of changing the weights of the criteria. We put one case with 0.06 weight and another with equal weight.

Then, we enter 15 cases as weights of criteria for the TOPSIS method and rank the suppliers as shown in Figure 6. We show the results are stable in under 15 cases in terms of criteria weights.

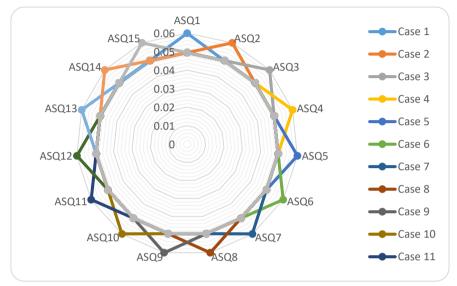

Figure 5. The fifteen cases in changing the weights of supplier's criteria.

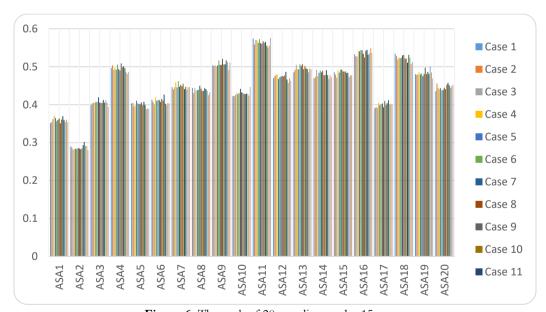

Figure 6. The rank of 20 suppliers under 15 cases.

5 | Conclusions

To build a trustworthy and effective supply chain, companies must evaluate the quality of their suppliers. Businesses may guarantee that their suppliers reliably provide high-quality goods and services that align with rules and consumer expectations by implementing a thorough review procedure. Considerations such as supplier reputation, financial stability, product quality, production methods, delivery performance, regulatory compliance, and customer service are all part of an exhaustive evaluation. Through this review process, businesses may improve operational efficiency, decrease defects and recalls, detect risks, and maintain

compliance. When looking to build solid and mutually beneficial connections with suppliers, examining their dedication to continual development, innovation, and the possibility of long-term partnerships is essential. Reduced risk, higher-quality products, adherence to regulations, more efficient operations, and a good name for the company are all advantages of supplier quality evaluation. Businesses may stay ahead of the competition, meet consumer expectations, and succeed in the long run by putting supplier quality evaluation first. We conducted this study at a drug company to select the best supplier. We used 15 criteria and 20 suppliers. We used the MCDM methods to evaluate the quality of suppliers. The TOPSIS method was used to rank the suppliers. The TOPSIS method was integrated with the neutrosophic set to overcome the uncertainty in the evaluation process.

Acknowledgments

The author is grateful to the editorial and reviewers, as well as the correspondent author, who offered assistance in the form of advice, assessment, and checking during the study period.

Author Contributation

All authors contributed equally to this work.

Funding

This research has no funding source.

Data Availability

The datasets generated during and/or analyzed during the current study are not publicly available due to the privacy-preserving nature of the data but are available from the corresponding author upon reasonable request.

Conflicts of Interest

The authors declare that there is no conflict of interest in the research.

Ethical Approval

This article does not contain any studies with human participants or animals performed by any of the authors.
